Pulmonary tuberculosis and cancer TUBERK. KERD. (Budapest)
1955, 8/1 (4-8) Illus. 6

In 10% of 143 cases of cancer of the lungs pulmonary tb was found. Although it was often not possible to associate the 2 processes; in some cases they occurred in the same location. Two cases of cavernocarcinoma were observed. The authors also performed histological studies of the lungs in pulmonary tb with a special view to the presence of atypical epithelial proliferation and point out that hyperplastic changes of the alveolar epithelium and metaplastic changes of the bronchial epithelium are not infrequently met with in tuberculous scars. In 4 cases alveolar cell carcinoma was observed to originate from tuberculous scars. The possible carcinogenic effect of some antituberculosis is also considered.

LACERTA MEDICA Sec.16 Vol.4,4 Cancer April 56

1432. BÁLO J., KASSAY D. and BIKEALMI A. Univ. de Méd., Budapest. Les adénomes bronchiques et leur importance *Bronchial adenoma and their importance* Bull. Ass. franç. Cancer 1955, 42, 1 (76-96) Tables 1 Illus. 12

Reference is made to the fact that bronchial adenoma, a benign tumour, although regarded by some workers as an epithelioma with changed stroma liable to degenerate, occurs somewhat more frequently in women than in men and appears at an earlier age than cancer. Its site of origin is often the main bronchus. Its histological structure is not constant. Hamperl distinguishes between carcinoids, which first appear in the Lieberkuhn crypts and are said to be benign, and the rarer cylindromata, originating from the bronchial glands and susceptible to degeneration. The present authors distinguish at least 4 varieties: the solid form, the glandular form, the osteogenous adenoma and the mixed-tumour type. Delarue, Depierre and Paillas add a form with myo-epithelial cells, with a distinct capacity of malignant degeneration. A total of 18 cases of adenoma are studied; 2 of them were discovered at post-mortem examination. Some showed the 'iceberg' type. In 15 instances the adenoma was solid, and in one, osseous fringes were observed. For this type, the term of osteogenous adenoma is proposed. In one other case the structure was glandular. Three times the adenoma was removed endoscopically, 11 times by pneumonectomy and once by lobectomy. One patient refused the operation, and one case was inoperable. Bronchotomy could be performed only rarely. Radiotherapy is without effect. Mention is made of treatment with the use of radium needles. Many references.

and their significance ORV. HETIL. 1955, 96/48 (1317-1323) Tablo:
Illus. 5

Fifteen cases of bronchial adenoma were reported (9 female, 6 male), 2 of them at
autopsy while the others were observed at bronchoscopic examination. The age inci-
dence was usually under 40. Histologically 4 types could be distinguished: solid,
glandular, ossifying and mixed form resembling parotid tumour. In 3 cases endo-
bronchial operation and in 8 cases pneumonectomy was the successful therapy. The
practical importance of the differential diagnosis between bronchial adenoma and
lung cancer was stressed.

In agreement with the opinion of others, it is suspected that cancer of the lung may be of multicentric origin. In addition, cancer gives rise not only to chronic inflammations but it is the point of origin of the mitogenetic radiations (in the sense of Gurvich) producing epithelial metaplasias in its vicinity.

Cancer Res., Med. Univ., Budapest *Pulmonary infarcts and pulmonary carcinoma* Cancer (Philad.) 1956, 9/5 (918-922) Illus. 5

A study of 50 cases of haemorrhagic pulmonary infarcts by means of serial sections disclosed alveolar-cell hyperplasia and squamous metaplasia at the periphery of the infarcts. Two cases were observed in which organized thrombi and alveolar-cell carcinoma were present. It is postulated that lung cancer of alveolar-cell or squamous-cell type can develop from foci of proliferation of this type. The authors suggest that the increase in cardiovascular disease with its frequent complication of pulmonary embolism has contributed to the increased incidence of lung cancer.

Abstract : Collagen consists of two chemically firmly bound
components, procollagen and metacollagen. These
components are preserved by contractions, and this
process should be considered as a reversible reaction.
By dilatation, procollagen is washed out of collagenous
fibers, and the remaining part of collagen consists of
metacollagen. Under influence of heat, metacollagen

Title : Pathologico-Anatomic Investigation of 62 Patients Who Died from Cystitis.

Orig Pub : Vopr gyogy. os venerol. szemle, 1956, 10, No. 3, 97-107.

Abstract : Characteristic pathologico-anatomic changes for cystitis were not revealed. The adipose and parenchymatous degeneration of the cardiac muscle developed in 49 cases, of the liver in 39, of the kidneys in 31 cases. Inflammation of the serous membrane, atrophy of the endocrine glands, their adenoma and cyst are observed rarely. The changes of the various forms of cystitis are generally identical. The pathological organic changes do not depend upon the duration of the disease and the applied therapeutic measures. -- Budovari Ishtvan.

The pulmonary carcinoma is treated on the basis of 200 personal cases (post-mortem material and surgical specimens). The author also studied 23 cases of lung adenoma and describes his experiments on the experimental production of these tumours in mice by means of narcotics, sex hormones, isoniazid, etc. He distinguishes between adenomas and mixed tumours of the salivary gland type (1 case). Separate chapters are devoted to cicatricial carcinoma (chronic anoxaemia on the margins of old infarcts causes epithelial proliferation), other precarcinomatous conditions, and to carcinoma in situ. The book is excellently illustrated with a great many macrophotos and microphotos, which are partly in colour. (V, 15, 16)

624. Effect of intraperitoneal administration of elastase on white rats. BALÓ J., BANGA I., JUHÁSZ J., SZABÓ D. and SZALAY E. 1. Dept. of Pathol. Anat. and Exp. Cancer Res., Med. Univ., Budapest *Gerontologia (Basel)* 1957, 1/6 (315-324) Graphs 1 Tables 2 Illus. 2

Experiments were carried out with a preparation of elastase 80 E.U./mg. Using white rats, i.p. administration of 25-30 mg. elastase in a single dose corresponds to lethal dose. In this case extreme dilatation of peritoneal capillaries and diapedesis bleedings are observed and collapse follows within 50 min. White rats tolerate 1/5 of the lethal dose daily over a longer period of time. After daily i.p. administration of 5 mg. elastase during a period of 90 days the pancreas enlarges considerably and the elastase activity corresponding to 1 g. dry material increases markedly. I.p. treatment with elastase has been combined with cholesterol feeding. Elastase activity of the pancreas following cholesterol feeding does not increase. Elastase activity in the pancreas after simultaneous administration of cholesterol and elastase is less than after elastase treatment alone. Baló - Budapest

1204. CYSTIC DISEASE OF THE SPINAL GANGLIA - A spinalis ganglionok tömlös megbetegedéséről - Baló J. Budapesti Orvostudományi Egyet. I. Korbonctani és Kisérleti Rákkutató Intézetének Közl., Budapest - IDEGGY.

SZ. 1957, 10/5-6 (142-144) Illus. 3

Report of a case of a 58-year-old woman who suffered for 25 yr. from neurofibromatosis and died after a subacute exacerbation of the disease. Post-mortem examination revealed a cystic degeneration of all 60 spinal ganglia, with a degeneration of the tracts of Goll and Burdach along the whole spinal cord. In the area of the anterior and lateral fascicles of the pyramidal tract there were some demyelinated portions which did not correspond to the location of particular tracts. The pathogenesis of this disease is still unknown. In opposition to the hypothesis of 'spinal ganglionic apoplexy', which may lead to colliquation, the author emphasizes the possibility of pressure having been exerted by the hundreds of neurofibromatous nodules on the lymphatic circulation alongside the spinal nerves, which serves as an additional channel for the CSF as well.

1540. The tumour-inducing effect of glandubolin Über die geschwulsterzeugende Wirkung des Glandubolins. KENDREY G., BALÓ J. and JENÁSZ J. i. Inst. für Pathol. Anat. und Exp. Krebsforsch., Med. Univ., Budapest *Acta morph. Acad. Sci. hung.* 1958, 8/1 (95-104) Illus. 4

An investigation was made of the tumour-inducing effect of 'glandubolin', an oestrogen, i.p. administered to white mice, both in oily and aqueous (containing urethan) solution. Multiple adenomas of the lung developed in both series. The first positive finding was noted after 237 days, using the aqueous solution. After 8 months, 36% of the animals treated with the aqueous solution had adenomas of the lung, while only 13% of the animals treated with the oily solution showed these adenomas, and besides in a lower number. Evidently, urethan can intensify the effect of the oestrogen.

3270. VIRAL HEPATITIS AS THE PATHOGENIC FACTOR FOR THE DEVELOPMENT OF LIVER CIRRHOSIS - Die Rolle der Virushepatitis für die Entstehung der Leberzirrhose - Baló J., Besznyák I. and Kendrey G. Inst. für Path. Anat. und Exp. Krebsforsch., Med. Univ., Budapest - SCHWEIZ. Z. ALLG. PATH. 1958, 21/6 (1064-1074) Illus. 7

In autopsy material covering a period of 5 years (2,345 cases), 20 reports point to virus hepatitis among 57 cases of liver cirrhosis. In 6 cases the transition from hepatitis to cirrhosis occurred within one year. Four of these 6 cases corresponded to Laënnec's cirrhosis and 2 to the coarse nodular type. Histologically, inflammation predominated in these cases. In 14 cases a time span of 2 to 21 years existed between the hepatitis and death. In this group 5 cases were of the coarse nodular type and 8 cases were of Laënnec's type. One case proved to be hypertrophic cirrhosis. In these cases parenchymal regeneration dominates the signs of inflammation.

"Crystalline Amyloid."

Budapest, A Magyar Tudományos Akadémia V. Orvosi Tudományok Osztályának
Közlemenyei, Vol XVI, No 1, 1965, pages 97-104

Abstract: [Authors' Hungarian summary] Urethane (ethylurea) was administered intraperitoneally to rats in order to induce pulmonary adenomas. Such adenomas developed in 18 of the 42 rats treated in this manner. A pathohistological study was carried out on the organs of 30 rats and the presence of more or less severe forms of amyloidosis was found. The most severe changes occurred in the kidneys and liver. In the liver, amyloid was deposited in the walls of the vessels and in the connective tissue; in addition, round objects of a radial structure consisting of amyloid crystals could also be demonstrated in the liver. Crystalline amyloid is eminently suited for the study of problems related to amyloid, such as chemical structure and solubility conditions.

"Histopathological Findings in Animal Experiments Concerning the Etiology of Viral Hepatitis."

Budapest, Acta Microbiologica Academiae Scientiarum Hungaricae, Vol XII,
No 4, 1965/66, pages 357-361.

Abstract: [English article, authors' English summary modified] An attempt was made by a research team at the Institute of Hygiene of the university to reproduce the results of BERTOK et al. who reported the experimental transmission of epidemic hepatitis virus to rats. The histological findings in the liver of 34 rats used in the reproduction experiments are presented in this paper. No pathological change was found in the liver of infected and control rats which received a normal synthetic diet. The changes in the liver of infected and non-infected animals kept on the ethionine diet were identical. There were significant differences in the histological findings in the liver obtained from human or canine victims of infectious hepatitis, and in the liver of rats treated with ethionine and infected subsequently

TITLE: On the stability of the eigenelements of potential operators

PERIODICAL: Referativnyy zhurnal, Matematika, no. 11, 1961, 75-76,
abstract 11B403.(Tr. Tbilissk. gos. ped. in-ta, 1959,
14, 119-126)TEXT: In a Banach space let be given the functional $F(x)$ and the hypersurface $\varphi(x) = \alpha$, where $\varphi(x)$ is a quadratic functional.
Considered is the equation

$$\text{grad } F(x) = \lambda \text{ grad } \varphi(x), \quad \varphi(x) = \alpha$$

λ being a real number; one assumes that this equation possesses the solution (x_0, λ_0) and one asks, whether this solution is stable under

small perturbations of the operator $\text{grad } F(x)$ with respect to the hyperplane ($\varphi = \alpha$). The investigation of this question is accomplished by aid of the theorem on implicit functions, while the possibility to apply this theorem depends on the fact whether a certain linear operator

is invertible or not. In the present paper one nominates certain

On the stability of the eigenelements... C111/C444

conditions under which this linear operator is invertible and consequently the corresponding equation is stable. In the case of the Hilbert space sphere and hyperboloid are examples for surface, satisfying the conditions of the article. In this paper one also investigates a class of infinite systems of non-linear equations which generalises the system considered by the author.

Considered is the functional, defined on the unit sphere of the space L_2

$$F(x) = \sum_{\alpha_1, \dots, \alpha_n=1}^{\infty} a_{\alpha_1 \dots \alpha_n} \varphi_1(x_{\alpha_1}) \dots \varphi_n(x_{\alpha_n})$$

where the numbers $a_{\alpha_1 \dots \alpha_n}$ being symmetrical with respect to all indices satisfy the conditions $\sum_{\alpha_1 \dots \alpha_n=1}^{\infty} a_{\alpha_1 \dots \alpha_n}^2 < \infty$, the functions

$\varphi_i(s)$ ($i=1, \dots, n$) being twice continuously differentiable on $[-1, +1]$

Card 2/3

32507

S/044/61/000/011/030/049
 C111/C444

On the stability of the eigenelements...
 and $\varphi_i(0) = 0$. Proved is the existence of the solution of the infinite system, the left hand of the gradient of the functional $F(x)$ being

$$\sum_{i=1}^n \varphi'_i(x_{\alpha_1}) \sum_{\alpha_1, \dots, \alpha_n=1}^{\infty} a_{\alpha_1 \dots \alpha_n} \varphi_1(x_{\alpha_2}) \dots \varphi_{i-1}(x_{\alpha_{i-1}}) \varphi_{i+1}(x_{\alpha_{i+1}}) \dots$$

$$\dots \varphi_n(x_{\alpha_n}) = \lambda x_{\alpha_i}, \alpha_1 = 1, \dots, \sum_{i=1}^{\infty} x_i^2 = 1.$$

X

In case of $\varphi_i(s)$ being power functions, the condition for the stability of the normed solution under small perturbations of the system coefficients is given.

TITLE:

Device for measuring secondary radiation, operating with a
reflecting olystron-autodyne

PERIODICAL:

Izvestiya vysshikh uchebnykh zavedeniy. Priborostroyeniye,
v. 4, no. 2, 1961, 3-9

TEXT: This article describes a device developed at the kafedra radio-tehniki Leningradskogo instituta tochnoy mekhaniki i optiki (Department of Radio Engineering of the Leningrad Institute of Precision Mechanics and Optics), where the problem of replacing reception- and transmission channels was radically solved through application of the autodyne principle by means of a reflecting olystron, the latter serving not only for generating the emitted oscillations, but also for detecting oscillations which are received as a consequence of secondary radiation of the objects concerned. When the object to be investigated is shifted in the radiation field of the device, the reflected high-frequency energy acts on

Card 1/8

22548

B124/B206

Device for measuring...

the clystron-autodyne and generates at its output resistance a voltage with Doppler frequency proportional to the energy of the secondary radiant flux. The device for measuring the parameters of secondary-radiation sources was built according to the block diagram shown in Fig. 2. It contains the following main components: 1) the measuring channel consisting of the clystron generator, a directional coupler, an antenna and a measuring amplifier; 2) a system for controlling the clystron-autodyne sensitivity, consisting of a generator for sensitivity control, the clystron-autodyne, a measuring amplifier and a sensitivity-control indicator; 3) a system for controlling the autodyne-generator power output, consisting of a directional coupler, a detector, an amplifier and an indicator for output control; 4) a system for recording the movement parameters of the model, consisting of a device for recording the rotation (electronic counter with rotation indicator) and a velocity recording device (velocity pickup and -indicator); 5) a control panel intended for switching on and adjusting the entire measuring device as well as other devices representing part of the measuring complex, and 6) the current sources. The clystron-autodyne is connected with the antenna and serves for generation, reception and autodyne detecting. In the presence of a

Card 2/8

Device for measuring...

S/146/61/004/002/001/011
B124/B206

moving object in the radiation field of the device, the reflected energy passes to the antenna and acts on the clystron autodyne, thus causing working conditions corresponding to the change of its outer high-frequency load. In this way, an intelligence signal with Doppler frequency is generated in the load resistance of the clystron-resonator circuit. For easier calculation of the autodyne-generator reaction on changes of the outer high-frequency load, the notion of sensitivity is introduced with the aid of which the ratio of the signal voltage obtained at the load resistance of the autodyne, to the corresponding change of the outer conductivity of the clystron is denoted, i.e.,

$$S = \frac{U_{sign}}{\Delta Y_{ext}/Y_{ext}}$$

The analysis of the expression for the sensitivity shows that this strongly depends on the selection of the operating point within the generation zone in the reflecting clystron. The approximate dependence of the sensitivity along the generation zone is given graphically in Fig. 3, from which it can be seen that maximum sensitivity during operation can be obtained at the zone borders, the working conditions of the generator-autodyne being, however, rendered very unstable thereby. For an

Device for measuring...

increase of the dynamic range of the device and the stability of its operation, the operating point of the clystron within the generation zone must be selected with a sensitivity of 0.8 to 0.9 of the maximum value. The noise level of the device lies at 1 mv, warranting at least equal sensitivity for the receiver channel as for the direct-amplifier-receiver. The voltage pulsation amplitude was reduced by means of suitable filters and a high degree of stability of the supply voltages; a further measure for increasing the sensitivity was the selection of the working frequency band of the measuring channel. Fig. 5 shows a simplified diagram for sensitivity control. The device described mainly serves for measuring the secondary radiation energy, which is required for measuring reflection coefficients of surfaces of different shape, composition and structure, for measuring secondary radiation diagrams of various objects, etc. It can also be used for contactless measurements of displacements and vibrations with small amplitudes, for measuring vibrations with arbitrary maximum frequencies, etc. This study was recommended by the Department of Radio Engineering of the Association. There are 5 figures and 4 Soviet-bloc references.

Title : The Yield Effect of Spraying Seeds with Micronutrients

Orig Pub : Izv. AN LatvSSR, 1957, No 6, 33-34

Abstract : Results are given of vegetative (soil cultures) and field tests where seeds have been sprayed with various doses of borax, borate and CuSO₄. The method has been applied to several cultures: carrots, sugar and red beet, the Swedish turnip, flax, corn, oats, barley and vetch. If the seeds were sprayed and sowed on the same day, the germinating capacity was not reduced at a dosage of 8-12 g/kg for borate and 2-4 g/kg for sulphate. The crop then rose. Also, the coefficient describing the use of microfertilizers increased abruptly, compared with that of the ordinary manner of applying the fertilizers one after the other. A test with the combined application of microfertilization and seed soaking in fungicide

ABSTRACT: The results of experimental investigations of the light intensity of single microplasma and its role in the total light emission of a p-n junction are presented and discussed. Finely diffused n-type boron-doped silicon p-n junctions embedded not deeper than 2μ below the surface of the specimen were used to facilitate observation of light emission over the whole (about 2 mm^2) area of the junction. The intensity of light from a microplasma as a function of reverse voltage shows a maximum after which it subsides. At a given reverse voltage, the intensity of light diminishes with rising temperatures while its maxima shift toward lower voltages. The integral light intensity as a function of the reverse voltage has a similar general character, but it greatly exceeds the sum of the individual light intensities of the microplasmas,

and its maximum of ten shifts beyond those of the microplasmas as a result of time differences between microplasma flashes. Several integral maxima may develop from the same cause. The light intensity maxima of microplasmas were found to indicate the turning point in the punch-through mechanism from the avalanche to the thermoelectric. Concurrently, light intensity can serve as an indication of the predominant mechanism: when light intensity grows with the current, the shock ionization is the principal source of carrier multiplication; otherwise, the thermal ionization is the main factor. Purely thermal punch-through starts with the extinguishing of light emission; the extinction being believed to be actually a change of the wavelength into the infrared. The experiments demonstrated a close relation between the mechanism of punch-through and the intensity curve of light emission, but a detailed spectral analysis of light emitted by microplasmas needs further investigation.
